## Ecosystems for Mountain Innovations

# iNEST - AMC

Presenter: Pasqualina Sacco - unibz

## The decision-making context

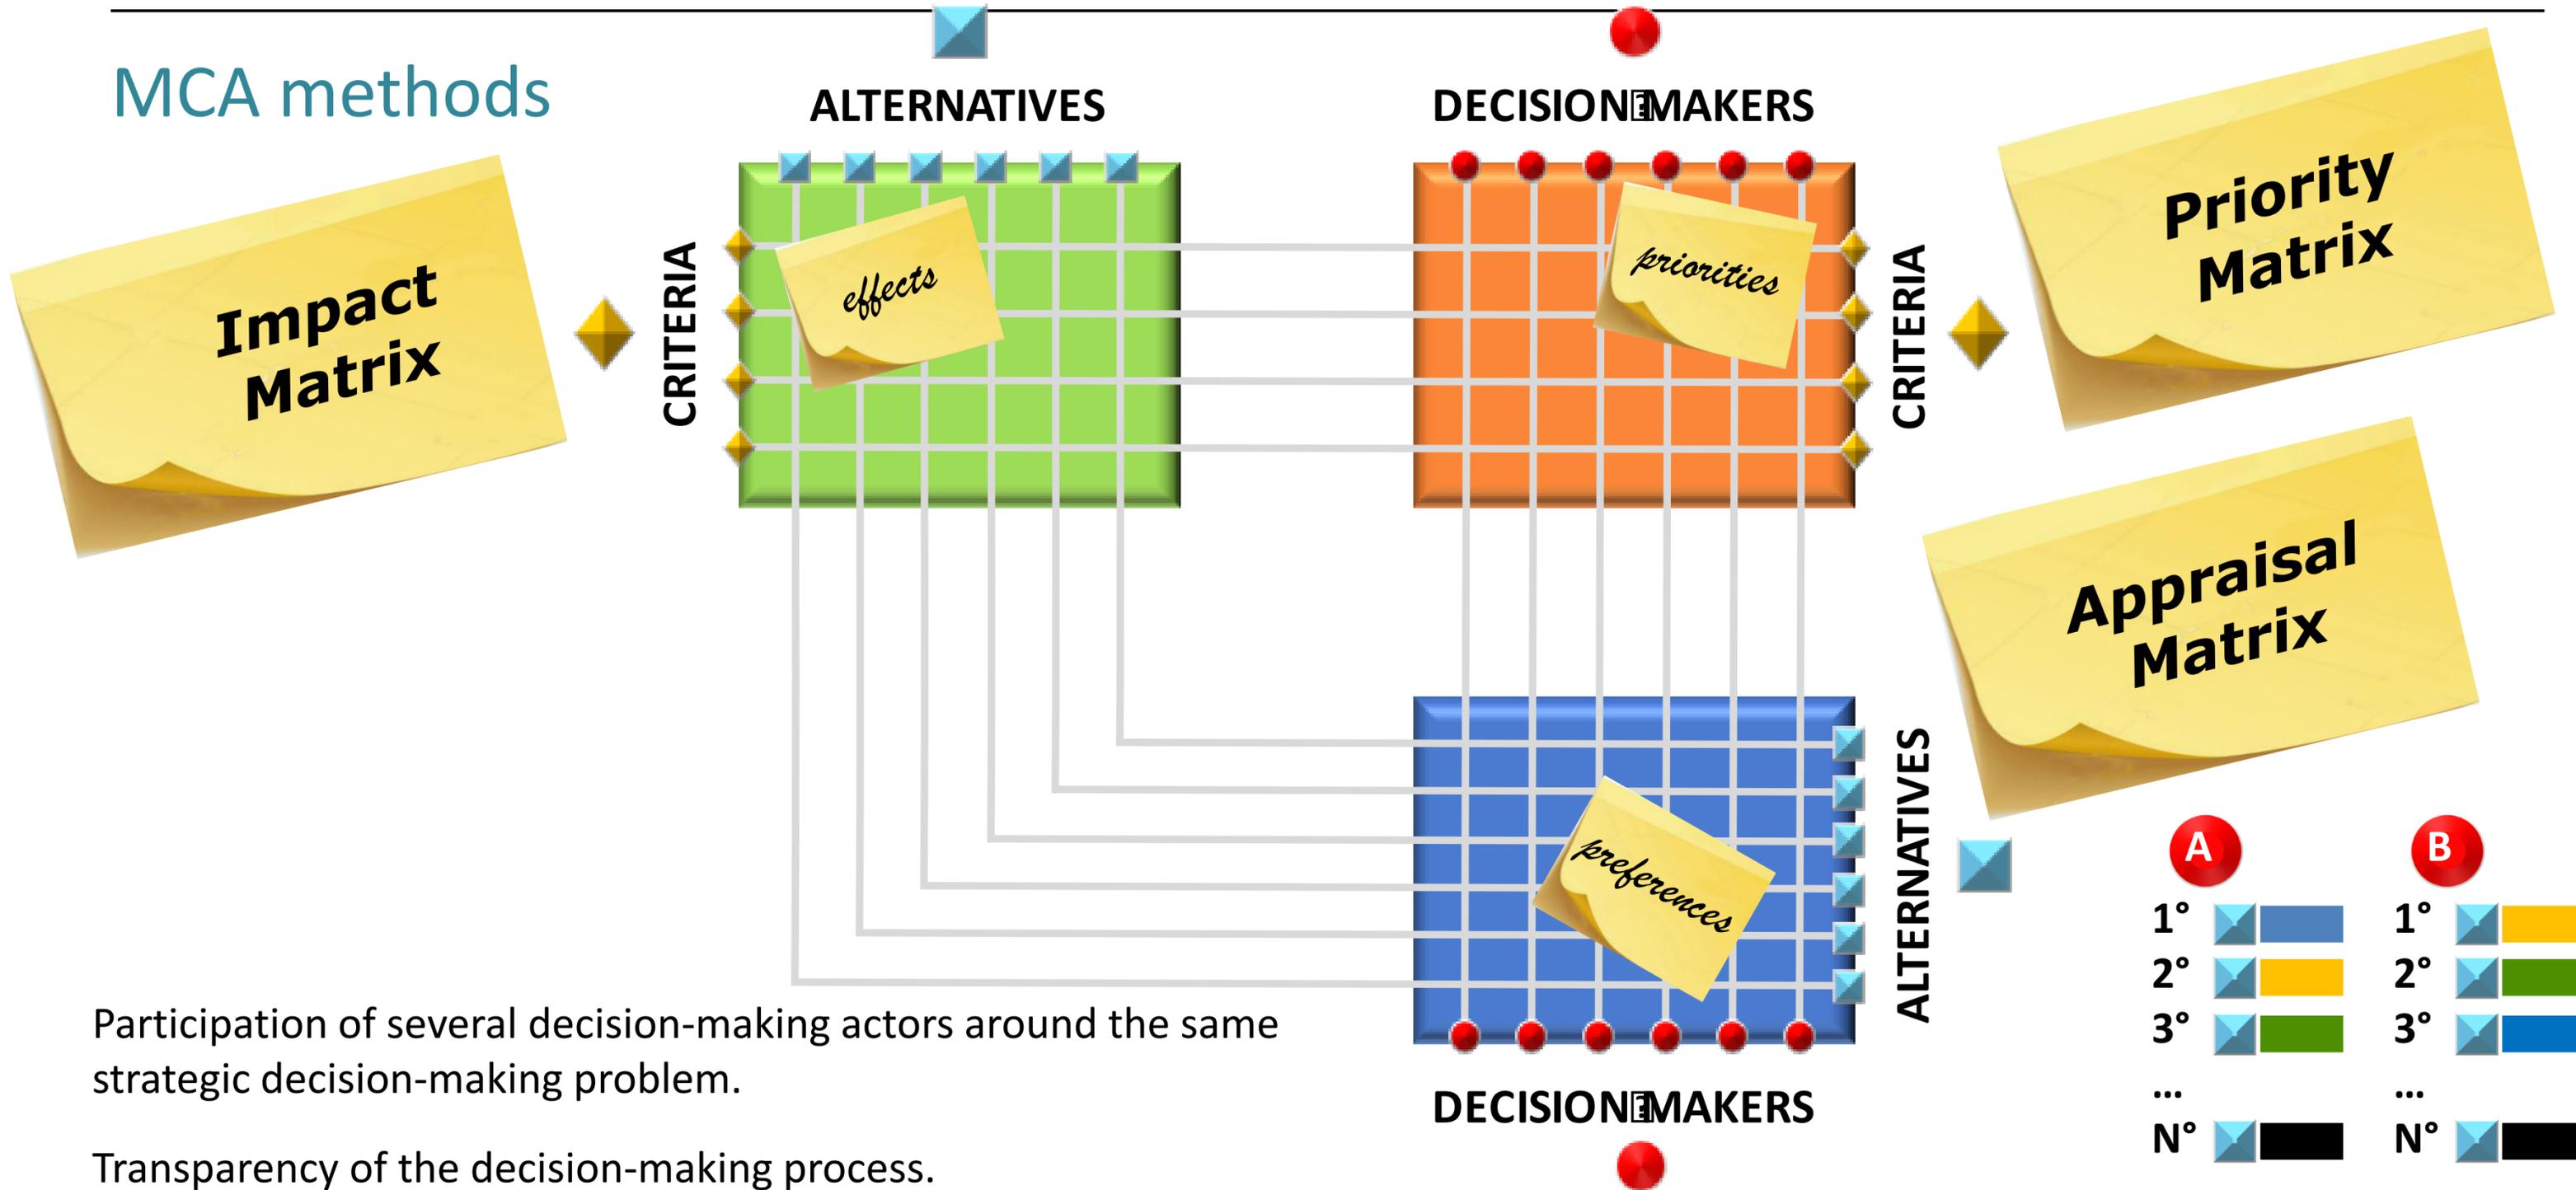

**Decision-making process:** the ability to use judgments in making decisions based on the information available.

Given the inherently subjective nature of decision-making, when a decision-maker is tasked with making a choice impacting the community, issues of **objectivity** and **transparency** in the decision-making process emerge.

**Mountain systems are complex by nature:**

- Ecological and human components coexist, each with their own specific “interests” (**multi-criteria**).
- Impacts affect various people directly and indirectly (**multi-actor**).
- Multiple stakeholders need to come together to reach a shared decision (**compromise**).

# MCA methods

Participation of several decision-making actors around the same strategic decision-making problem.

Transparency of the decision-making process.

# MCA for...

Describing the decision-making problem objectively and based on reliable data (**impact matrix**).

Considering different perspectives (**priority matrix**).

Assessing the convergence margins towards a shared solution (**preference matrix and sensitivity analysis**).

Impact matrix

| Criteria                                     | C/B | Rye bread | Barley beer | Cow cheese | Goat cheese | Domain |

# Sensitivity analysis

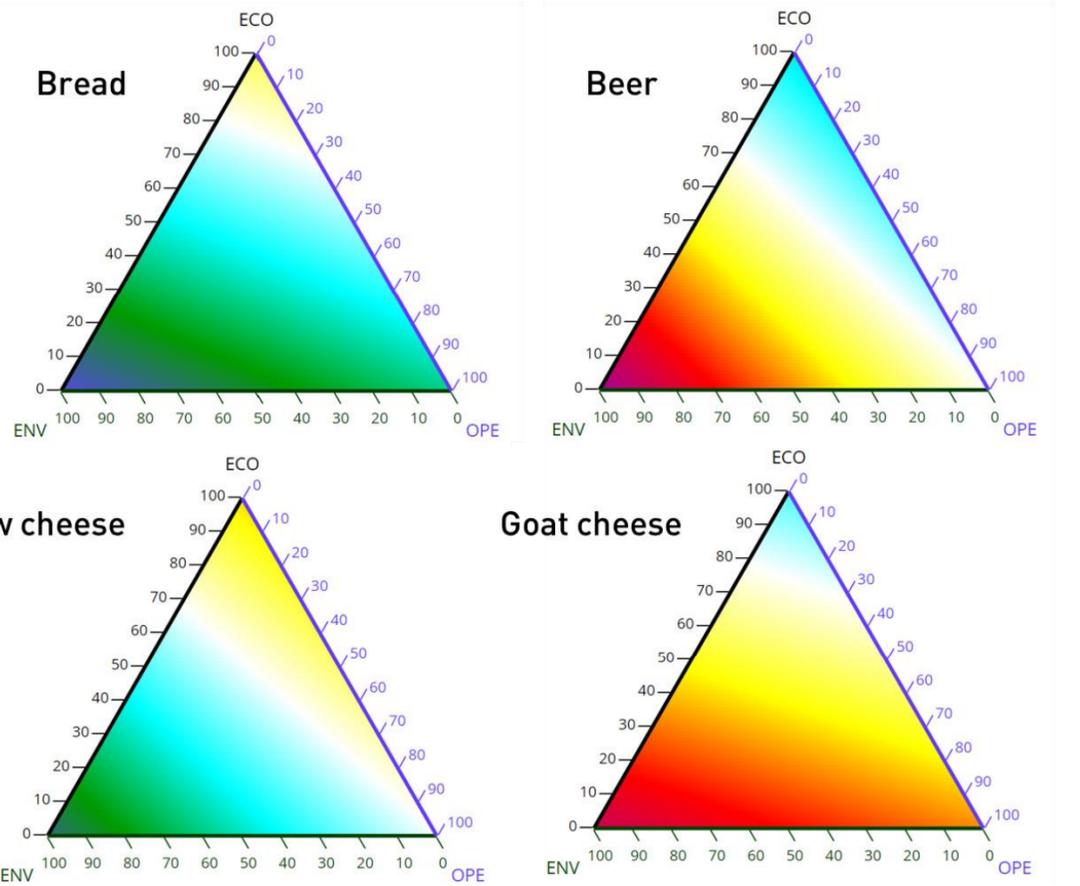

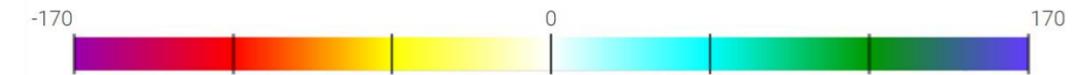

Best alternatives

Worst alternatives

- Cereals-based production systems represents a good alternative for a wide range of actors.
- Bread and cow cheese range in a positive value set and could be a satisfactory choice for most decision-makers.

3-group sensitivity, based on balanced profile, unibz proprietary software

## Before moving to the software tool ...

- MCA methodologies offer a common platform in which to integrate the **different criteria** (= **types of impact**) to be considered.
- For the transparency and sharing of the decision-making process, it is essential to have tools in which several decision-makers can **express their priorities autonomously**, once the list of criteria to be assessed has been shared and accepted.
- MCA **is not** an optimisation method, but an approach by which a decision-making **convergence** on a **reasonable compromise** is aimed at.
- For stability in the choices of final alternatives, it is useful to use sensitivity analyses on decision profiles.

**Profile**  
Scientific Network South Tyrol

This is a freeware web application that allows decision-making processes to be set up and managed according to multi-criteria approaches. It is a multi-criteria tool derived from the ELECTRE methods and criteria of different nature, unanimously agreed upon by all the actors involved in the process. Each session deals with a single decision-making problem comparing different alternatives to choose from, apply elements of the problem (the impacts of each alternative) from the subjective ones (priorities of the different decision-makers). The result of the session is a ranking of preferences of the alternatives subject better assess the stability of the results, the calculation platform also allows sensitivity analyses to be carried out on the priorities of the decision-makers, after grouping the criteria into homogeneous categories.

The application was developed by the Free University of Bozen-Bolzano and adapted to the needs of the decision-making processes foreseen within the activities of the Consortium iNEST Interconnected North Generation EU (funds of the PNRR iNEST project, promoted by the European Union NextGenerationEU (National Recovery and Resilience Plan - Mission 4 Component 2, Investment 1.5 - D.D. 1058 23/06/2022,

A quick overview of the use of the application can be found [here](#). For a general description of the structure of the application, with examples on how to use it within the issues addressed in the iNEST Project, :
